The Book that Should Have Been in the Box

User manuals, reference guides, project documentation, equipment specifications and other technical documents are increasingly subjected to high quality standards. How do we ensure that our research efforts are keeping pace with this increasing importance of documentation quality. This volume includes studies from researchers as well as practitioners. It presents three approaches towards document quality: • Product-orientation, with an eye for usability in various manifestations such as tutorials, concept definitions, tools for user interface design, methods of eliciting user feedback, and cultural differences; • Process-orientation, in which the quality of technical documentation is regarded as an ongoing process involving sub-steps such as storyboarding, pre-testing and use of automation tools in writing and producing documents; • Professional orientation, in which attention is given to the professional aspects of creating technical documentation. The volume will be of interest to a broad audience of writers, managers and trainers with technical and non-technical backgrounds, such as technical communicators; communication managers; technical communicators; trainers in computer usage; teachers, researchers and students of (technical) communication.

*Manufacturers are becoming more aware of human factors in product design as a major competitive issue. In many product areas, manufacturers have reached a technology ceiling, which simply means that it is increasingly difficult to get ahead of the competition in terms of, for example, functionality, technical reliability or manufacturing costs. As a consequence, design has become a major battleground for manufacturers, and usability is recognized as being a central tenet of good design. This book*

*provides a unique snapshot of current practice in human factors, identifying methods and techniques that work well under tight constraints and providing case study evidence of their effectiveness. The commercial implications of usability are discussed, and special attention is paid to two key trends: inclusive design and smart products. Inclusive design is about meeting the needs of all users with one design, which includes the elderly and the disabled. Smart products are multi-functional products with electronic interfaces containing a vast array of "helpful" functions. Industrial designers and manufacturing executives will find this text enlightening.*

*If you have a chip on your windscreen, an annoying scratch on your paintwork, or a key fob that's not working, this book could save you money. There are so many simple fixes that can be made without the need to take your car to the local garage.*

This volume is intended to expand the dialogue and interest among both practitioners and academicians in a problem area worthy of attention by all. The concept of disaggregation admits to our current inability to solve many types of interrelated hierarchical problems simultaneously. It offers instead a sequential, iterative process as a workable and necessary procedure. The papers in this volume are selected from those presented at a Disaggregation Conference held in March, 1977 at The Ohio State University. We heartily applaud all those who participated in the conference and particularly appreciate the cooperation of those authors whose work is published in this collection. Part A contains four papers which define the various dimensions of disaggregation. The paper by Martin Starr, which was the text of his luncheon address at the conference, provides several interesting perspectives to the problem. Although disaggregation suggests tearing apart, as Professor Starr illustrates with his butterfly example, also suggests a putting together or a synthesis which recognizes interrelationships and dependencies. The next paper by Lee Kra jewski and Larry Ritzman offers a general model of disaggregation for both the manufacturing and service sectors. After reading the papers in this section, as well as the papers in subsequent sections, you will identify other dimensions to hierarchical decision making which go beyond this generalized model.
